

SOIL TEST CALIBRATION FOR DETERMINING PHOSPHORUS FERTILIZER REQUIREMENT OF APPLE

Habibur Rehman and Abdul Ghani*

ABSTRACT

Field experiments were conducted during 1988 and 1989 at 11 locations in the apple growing area of Swat. Phosphorus, at the rates of 0, 0.5, 1.0, 1.5 and 2 Kg P_2O_5 tree⁻¹ was applied alongwith basal dose of 1 kg N and 1 kg K_2O tree⁻¹. $NaHCO_3$ extractable soil P contents were correlated with apple fruit yields according to the modified Mistscherlich-Bray equations. For relating the soil test values with the yield the equation $\text{Log } (A-y) = \text{Log } A - c_1 b_1$ and for calculation of fertilizer the equation $\text{Log } (A-y) = \text{Log } A - c_1 b_1 - cx$ was followed.

The calculated and obtained yields of apple fruit for various soil test values and P fertilizer rates are reported. Based on the equations levels of soil P were established which may produce very low, low, medium and high yields as compared to the potential yield. Optimum yield (95% of the maximum) may be obtained if $NaHCO_3$ extractable P is not less than 10.65 mg kg⁻¹ soil provided the yield is not limited by other agronomic factors.
